Section 1

Introduction

1.1 Scope of the report

The purpose of this 2013 internet use and attitudes bulletin is to provide a single home for a number of key internet metrics across a variety of sub-groups within the UK adult population. It is designed to be a reference document for our stakeholders.

It provides the following data:

- Who is online and how this has changed since 2012, the percentage of the UK population who ever use the internet on any device, who has home access, and who accesses the internet from different types of location outside the home.

- The ‘breadth’ of people’s internet use, derived from an aggregation of the number of types of activities carried out by internet users, and focusing on selected types of activity.

- Information on people’s attitudes to internet safety, awareness of potential problems relating to protection and privacy, and critical understanding.

- Information about the levels of interest among non-users in different types of internet activity, any proxy use in the past year, and the proportions of non-users without any intention of getting home internet access, who give reasons relating to cost and to interest/need.

1.2 Key findings

- Three-quarters (75%) of UK adults aged 16+ say they have broadband internet access at home and 82% of UK adults aged 16+ say they use the internet either at home or in other locations. Neither of these measures have changed to any significant extent since 2012. Differences by age group are considerable – 95% of 16-24s say they use the internet, compared to 29% of those aged 75+.

- Forty-nine per cent say they go online via their mobile phone, an increase of ten percentage points on Q1 2012. Seventy-five per cent of 16-24s say they do this compared to 5% of those aged 65+. Fifty-six per cent of those in ABC1 households say they go online via their mobile, compared to 37% of those in DE households.

- Around one in five (22%) of those who use the internet at home or elsewhere are broad users of the internet (carrying out 11-16 of 16 types of activity). Around one quarter (26%) of those in ABC1 households are broad users, compared to 14% of those in DE households.

- Just under half (46%) of those who use the internet at home or elsewhere are narrow users of the internet (carrying out 1-6 of the 16 types of activity). Six in ten (60%) of those aged 55 and over are narrow users, compared to less than four in ten (37%) aged 16-35. Those in C2DE households are more likely than those in ABC1 households to be narrow users (53% vs. 42%).
• Sixty-two per cent of those who use the internet at home or elsewhere say they buy things online. A similar proportion of adults bank online (55%) or use social networking sites (53%), while over one third (36%) watch TV content online. Adults aged 65 and over are less likely to use the internet at home for these activities, and adults in the DE socio-economic group are less likely to bank or watch TV content online.

• Among those accessing the internet at home through a PC / laptop/ netbook or tablet, 66% say they use email filters to block unwanted or spam emails. This is less likely among those aged 55+ (58%) and among DE households (51%). Men are more likely than women to use email filters (69% vs. 63%).

• A majority of internet users (61%) say they make ‘formal’ judgements before entering personal details online, an increase of five percentage points since 2011. Those in ABC1 households are more likely to say they do this compared to those in C2DE households (66% vs. 53%).

• About one in five (18%) of all adult internet users say they read website terms and conditions and privacy statements thoroughly, which is a six percentage point decrease. Adults aged 65+ are more likely to say they read website terms and conditions and privacy statements thoroughly (28%).

• Among non-users, ‘proxy’ use of the internet by someone else on their behalf stands at 18%. Eleven per cent of those not intending to get the internet cite cost as their main reason, while 63% cite a perceived lack of interest, a five percentage point increase.

1.3 Overall trends over time

It is useful to provide some initial context of how take-up rates have developed over time, and to compare the internet with other digital media such as digital TV and DAB. Figure 1 sets out how take-up has increased across a range of digital media.

Figure 1: Take-up of key media since 2000

Proportion of individuals (%)
Figure 2 shows the extent to which UK adults in 2010, 2011, 2012 and in 2013 use a computer or laptop at home to go online, and also shows those using mobile phones or games consoles/games players to go online.

**Figure 2: Devices used to go online: 2010, 2011, 2012 and 2013**

1.4 Who is measured

It is important to monitor different sub-groups within the UK, as take-up and use of the internet is skewed, particularly by age and by socio-economic group. For example, while 95% of those aged 16-24 use the internet (anywhere), only 25% of those aged 75 and over do so. And almost twice as many internet users in ABC1 households as in DE households can be categorised as ‘broad’ internet users.

This *Metrics Bulletin* tracks the following groups wherever possible, given the survey base sizes and sampling:

- Age
- Gender
- Socio-economic group
- Low income / unemployed
- Rural / urban
- Ethnic minority group (EMG)
- Disability
- Devolved nations

The following considerations should be taken into account when looking at these groups:
Low income

Questions about levels of income in surveys tend to attract higher rates of refusal, especially among those on low incomes. This group is included in the report, but as refusal rates vary year on year, there is a degree of uncontrolled variation which means that any trend data should be viewed with caution.

Rural/urban

The government definitions of rural and urban differ between England and Wales, and Scotland, while the Northern Ireland Assembly allows definitions based on the research need. So in order to achieve consistent analysis by rurality, we have used UK Geographics’ Locale Classification. This is a proprietary measure based on the ONS criteria; details can be found at http://www.ukgeographics.co.uk/images/locale.pdf. A full description of the seven definitions and how they are classified as rural or urban can be found in Annex 1 of this report.

Ethnic minority group (EMG)

The ‘ethnic minority group’ comprises all those who answered that they belonged to groups within: Asian and British Asian; Black and Black British; Middle East and Arabic origin; Chinese or other ethnic group; mixed; or other. It should be noted that the group does not include other white ethnic groups such as people from Poland, Australia etc.

Ofcom is aware of the limitations of such a broad categorisation, but to survey all these groups to provide robust individual measures would be prohibitive in terms of cost. As there are no internal controls for sub-category, there is a degree of uncontrolled variation, so we have not reported trend data. We have applied special weighting (derived from ONS data and an examination of Ofcom’s previous research) to these data to create an appropriate analysis group. This summary information is provided as an indicative measure, to show differences in take-up and attitudes, which in turn may enable stakeholder understanding and targeting of particular issues.

Disability

The ‘disability’ group comprises all those who answered that they had any conditions that limited their daily activities or the work they could do. In 2013, 14% of UK adults gave this response. The surveys did not set any quotas or sampling framework for the incidence of disability, and so, like the EMG group, this group should be seen only as an indicative measure of the habits and opinions of disabled people. Likewise, due to the degree of uncontrolled variation, trend data are not reported. We have applied special weighting, derived from examination of Ofcom’s previous research, to these data to create an appropriate analysis group.

1.5 What is measured

The first section of this report provides the key data about who is online and how this has changed since 2012. It sets out the percentage of the UK population who ever use the internet on any device, who has broadband access at home, and who accesses the internet from different types of location outside the home.

The second section examines the ‘breadth’ of people’s internet use. It measures this in two ways – by aggregating the numbers of types of activities carried out by those who use the internet at home or elsewhere, and by focusing on selected types of activity.
Internet use and attitudes bulletin 2013

The next section provides information relating to people’s attitudes towards their internet safety, and also to their understanding of issues relating to protection and privacy and critical understanding.

Finally, we look at non-users of the internet in some detail. We set out their levels of interest in different types of internet activity, and the extent of their agreement that the internet “makes life easier”. The section indicates levels of likely internet take-up, and the proportions of non-users without any intention of getting home internet access, who give reasons relating to cost and to interest/ need. The incidence of any proxy use in the past year is also documented.

1.6 Sources used

The metrics set out here come from two main sources - Ofcom’s thrice-yearly survey of take-up and trends (the Technology Tracker)\(^1\), and Ofcom’s Media Literacy Tracker\(^2\). Data from the Technology Tracker survey are from January – February 2013, while data from the Media Literacy Tracker are from September – November 2012.

1.7 Understanding the results

Measures from Ofcom’s Media Literacy Tracker are reported alongside measures from Q1 2013 from Ofcom’s Technology Tracker. Habits may have shifted in those intervening months, but the relative differences between the sub-groups remain pertinent.

Within each section, comparisons are made between the sub-group response and the all-UK figure for each of the age, socio-economic/ income and location/ nation groups, and for EMG and disability. Where a response is different to the all-UK figure, the cell has been coloured green (if the sub-group response is higher than the all-UK figure) or red (if it is lower), as shown in the example below. The exceptions are male/ female and urban/ rural, where the comparisons are to each other. Differences are statistically significant at the 95% level.

Tracking sub-groups over time requires large base sizes in order that percentage changes can be deemed statistically significant. All significant changes since 2012 for measures from the Technology Tracker and since 2011 for measures from the Media Literacy Tracker are indicated within each section in the rows labelled ‘% change’ for the UK overall figure.

The number of interviews conducted with the different sub-groups of UK adults detailed in this report is indicated in the rows labelled ‘base’. Where a sub-group base size is lower than 100 interviews, these responses have been excluded from the analysis and are indicated ‘**’ within the grid of measures.

\(^1\)http://stakeholders.ofcom.org.uk/market-data-research/statistics/
\(^2\)http://stakeholders.ofcom.org.uk/market-data-research/statistics/
### Internet reach: 2013

This section provides information about who is online and how this has changed since 2012. It sets out the percentage of the UK population who ever use the internet on any device, who has home broadband access, and who goes online from different types of location outside the home. Coloured cells indicate whether the sub-group response is different to the all-UK figure.

### Differences

Differences are statistically significant at the 95% level. Red cells signify lower and green cells signify higher. For male/ female and rural/ urban, the comparison is to each other.

### Notes

4 (TT Q1 2013, QE3) Q: Do you/ does anyone in your household have access to the internet at home? / Do you ever access the internet anywhere other than in your home at all?

5 (TT Q1 2013, QE9) Q: Which of these methods does your household use to connect to the internet at home?

6 (TT Q1 2013, QD28) Q: Which, if any, of the following activities, other than making and receiving calls, do you use your mobile for?

7 (TT Q1 2013, QE3) Q: Do you ever access the internet anywhere other than in your home at all?
## Section 3

### Internet breadth of use

The ‘breadth’ of people’s internet use is indicated in this section in two ways – by an aggregation of the numbers of types of activities carried out by those who use the internet at home or elsewhere, and by focusing on selected types of activity. Coloured cells indicate whether the sub-group response is different to the all-UK figure. The types of activity are ranked by the percentage of those saying that they ever do such things. Changes made to this question in 2013 mean that it is not possible to make comparisons with 2012.

*Differences are statistically significant at the 95% level. Red cells signify lower and green cells signify higher. For male/ female and rural/ urban, the comparison is to each other.*

*(TT Q1 2013, QE5A) Q: Which, if any, of these do you use the internet for? (NB Changes were made to this question in 2013 which mean that it is not possible to make comparisons with the 2012 findings. In 2012 the question asked those with access to the internet at home to state which activities were undertaken at home by anyone in the household. In 2013 the question asked those who use the internet at home or elsewhere to state which activities they personally undertake.)*

The 16 types of internet activity are: social networking sites, Twitter, emails, communications, purchasing, banking, radio/ audio services, games, health, government sites, information (work/ school/ college), watching TV content, watching video clips/ webcasts, downloading entertainment content, uploading/ adding content to the internet, real-time gambling/ trading/ auctions.

Section 5

Interest in the internet among non-users

This section provides information about the levels of interest among non-users for different types of internet activity, any proxy use in the past year, and the extent of users’ agreement that the internet “makes life easier”. It indicates levels of likely internet take-up, and the proportions of non-users without any intention of getting home internet access, who give reasons relating to cost and to interest/need. Coloured cells indicate whether the sub-group response is different to the all-UK figure.

** = Sub-group base size lower than 100 and therefore excluded from the analysis
† = It should be noted that these results could be an outcome of reluctance among some groups to ‘admit’ to cost barriers, or to other sorts of issues around non-take-up of the internet such as fear or lack of confidence
Annex 1

Technical note

1.1 Background

The metrics set out in this report come from two main sources - Ofcom’s thrice-yearly survey of take-up and trends (the Technology Tracker), and Ofcom’s Media Literacy Tracker.

Ofcom commissioned Saville Rossiter-Base to carry out both of these surveys. Interviewing for both surveys was conducted by Fieldworks, a specialist fieldwork agency, face-to-face, in the home, using pen and paper. Findings from the Technology Tracker are reported in Ofcom’s Communications Market Report and Consumer Experience Report. Findings from the Media Literacy Tracker are reported in Ofcom’s UK Adults’ Media Literacy Report.

1.2 Sampling

Interviewers are provided with specific addresses, with quotas of interviews to be achieved for each sampling point issued for the survey. The data are then weighted to the national UK profile for age, gender, socio-economic group and region. Matrix weighting has been used to achieve consistent profiles across the surveys. Special weights have been applied to respondents in each of the 65+, EMG and disability categories.

A total of 3,750 adults aged 16+ were interviewed for the Technology Tracker at 315 different sampling points in the UK. All interviews were conducted between 4 January and 28 February 2013.

For the Media Literacy Tracker, a total of 1,805 adults aged 16+ were interviewed at 200 different sampling points in the UK. All interviews were conducted between 24 September and 2 November 2012.

The grids within each section of this report indicate the number of interviews conducted with the different sub-groups of UK adults detailed in this report.
Local classification – urban-rural classification

As there is no ‘official’ rural-urban classification that is consistent across the UK, this research makes use of the classification developed by UK Geographics. This assigns to output areas and postcodes a rural-urban classification based on the nature of the settlement in which it resides. For Locale groups A-D, each city or town lying inside a larger conurbation is treated separately.

<table>

</tbody>
</table>

When creating rural-urban splits, Ofcom considers codes A-E to be urban and F-G to be rural.
